## PURIFICATION OF BIS(THIOHYDRAZIDE AMIDES)

## RELATED APPLICATION

This application claims the benefit of U.S. Provisional Application No. 60/844,776, filed on September 15, 2006. The entire teachings of the above  
5 application(s) are incorporated herein by reference.

## BACKGROUND OF THE INVENTION

Cancer is a group of diseases that are characterized by uncontrolled cell division. This uncontrolled division can compromise the function of an organism and ultimately may cause its death.

10 On average, in the United States, men have a 1 in 2 lifetime risk of developing cancer and women, a 1 in 3 risk. The International Agency for Research on Cancer estimated that there were 5.3 million new cases of cancer and 3.5 million cancer deaths worldwide in 2000. In the United States, more than 1.2 million new cases were diagnosed in 2002 and more than 550,000 people died of the disease. In fact, cancer is the second leading cause of death in the  
15 United States, exceeded only by heart disease.

Many cancers are immunosensitive. Immunosensitive cancers respond to immunotherapy, i.e., agents that stimulate the immune system. Examples of immunosensitive cancers include, renal cell carcinoma, melanoma, multiple myeloma, myeloma, lymphoma, non-small-cell lung cancer, bladder cancer, prostate cancer, squamous cell carcinoma, basal  
20 cell carcinoma, fibrosarcoma, malignant brain tumors, Kaposi's Sarcoma, chronic myelogenous leukemia (CML) and hairy cell leukemia.

Heat shock proteins (HSPs) are found in virtually all prokaryotic and eukaryotic cells where they support folding of nascent polypeptides, prevent protein aggregation, and assist transport of other proteins across membranes. The proteins in the Hsp70 family (referred to  
25 collectively as "Hsp70") play a dual role of protecting cells from lethal damage after environmental stress, on the one hand, and targeting cells for immune mediated cytolytic attack on the other hand. Increased expression of Hsp70 in the cytoplasm is known to protect a broad range of cells under stress by preventing the misfolding, aggregation and denaturation of cytoplasmic proteins and inhibiting various apoptotic pathways (Mosser, *et*  
30 *al.*, Mol Cell Biol. 2000 October; 20(19): 7146-7159; Yenari, Adv Exp Med Biol, 2002, 513,

281-299; Kiang and Tsokos, *Pharmacol Ther.* 1998; 80(2):182-201). However, membrane-bound Hsp70 provides a target structure for cytolytic attack mediated by natural killer cells.

Cells can experience stress due to temperature; injury (trauma); genetic disease; metabolic defects; apoptosis; infection; toxins; radiation; oxidants; excess/lack of nutrients or metabolic products; and the like. For example, it is known in the art that cells damaged in the following variety of medical conditions can experience a protective effect in response to Hsp70.

Protein misfolding/aggregation conditions resulting in neurodegeneration include Alzheimers' disease (Zhang, *et al.*, *J. Neuroscience*, 2004, 24(23), 5315-5321; Klettner, *Drug News Perspect*, 2004 17(5), 299-306); Huntington's disease (Klettner, *ibid*); Parkinson's disease (Auluck, *et al.*, *Science*, 2002, 295(5556), 865-868); and the like. Other neurodegenerative conditions include spinal/bulbar muscular atrophy (Sobue, *Nihon Shinkei Seishin Yakurigaku Zasshi*, 2001, 21(1), 21-25); and familial amyotrophic lateral sclerosis (Howland, *et al.*, *Proc Nat Acad Sci USA*, 2002, 99(3), 1604-1609; Sobue, *ibid*; Vlemminck, *et al.*, *J Neuropathol Exp Neurol*, 2002, 61(11), 968-974).

Ischemia and associated oxidative damage affects diverse tissues including: neurons and glia (Carmel, *et al.*, *Exp Neurol*, 2004, 185(1) 81-96; Renshaw and Warburton, *Front Biosci*, 2004, 9, 110-116; Yenari, *Adv Exp Med Biol*, 2002, 513, 281-299; Kelly and Yenari, *Curr Res Med Opin*, 2002, 18 Suppl 2, s55-60; Lee, *et al.*, *Exp Neurol*, 2001, 170(1), 129-139; Klettner, *ibid*; Klettner and Herdegen, *Br J Pharmacol*, 2003, 138(5), 1004-1012); cardiac muscle (Marber, M.S., *et al.* (1995) *J. Clin. Invest.* 95:1446-1456; Plumier, J.C., *et al.* (1995) *J. Clin. Invest.* 95:1854-1860; Radford, N.B., *et al.* (1996) *Proc. Natl. Acad. Sci. USA* 93(6): 2339-2342; Voss, *et al.*, *Am J Physiol Heart Circ Physiol* 285: H687-H692, 2003); liver tissue (Doi, *et al.*, *Hepatogastroenterology*. 2001 Mar-Apr;48(38):533-40; Gao, *et al.* *World J Gastroenterol* 2004;10(7):1019-1027); skeletal muscle (Lepore *et al.*, *Cell Stress & Chaperones*, 2001, 6(2), 93-96); kidney tissue (Chen, *et al.*, *Kidney Int.* 1999; 56: 1270-1273; Beck, *et al.*, *Am J Physiol Renal Physiol* 279: F203-F215, 2000.); pulmonary tissue (Hiratsuka, *et al.*, *J Heart Lung Transplant.* 1998 Dec;17(12):1238-46); pancreatic tissue (Bellmann, *et al.*, *J Clin Invest.* 1995 June; 95(6): 2840-2845), and the like.

Seizure conditions that damage neurons include, e.g., epileptic seizure (Yenari, *ibid*; Blondeau, *et al.* *Neuroscience* 2002, 109(2), 231-241); or chemically induced seizure (Tsuchiya, *et al.*, *Neurosurgery*, 2003, 53(5), 1179-1187).

Thermal stresses include hyperthermia conditions such as fever, heat stroke, and the like (Barclay and Robertson, *J Neurobiol*, 2003 56(4), 360-271; Sato, *et al.*, *Brain Res*, 1996,

740(1-2), 117-123); and hypothermia (Kandor and Goldberg, Proc Natl Acad Sci U S A. 1997 May 13; 94(10): 4978-4981).

Other conditions include radiation damage, e.g., from ultraviolet light to tissues such as murine fibroblasts (Simon, M.M., *et al.* (1995) J. Clin. Res. 95(3): 926-933), and light damage to retinal cells (Yu, et, al, Molecular Vision 2001; 7:48-56).

Trauma includes, for example, mechanical injury, e.g., pressure damage to retinal 10 ganglions in glaucoma (Ishii, *et al.*, Invest Ophthalmol Vis Sci, 2003, 44(5), 1982-1992).

Toxic conditions include doses of chemicals or biochemicals, for example, methamphetamine (Malberg & Seiden, Poster "MDMA Administration Induces Expression of HSP70 in the Rat Brain" Society for Neuroscience Annual Meeting, New Orleans, LA, October 25-30, 1997); antiretroviral HIV therapeutics (Keswani, *et al.*, Annals Neurology, 15 2002, 53(1), 57-64); heavy metals, amino acid analogs, chemical oxidants, ethanol, glutamate, and other toxins (Ashburner, M. and Bonner, J.J. (1979) Cell: 17:241-254; Lindquist, S. (1986) Ann. Rev. Biochem. 55:1151-1191; Craig, E.A. (1985) Crit. Rev. Biochem. 18(3):239-280; Morimoto, *et al.*, In: The Biology of Heat Shock Proteins and Molecular Chaperone, (1994) pp. 417-455. Cold Spring Harbor Laboratory Press. Cold Spring Harbor, 20 N.Y.); and the like.

Cystic fibrosis is a genetic disorder which results from a mutation in a single glycoprotein called the cystic fibrosis transmembrane conductance regulator (CFTR). As a result of the mutation, post-translational processing of CFTR cannot proceed correctly and the glycoprotein fails to be delivered to the cell membrane. Induction of Hsp70 has been shown 25 to overcome this defective processing and results in functional CFTR protein on the cell surface (Choo-Kang and Zeitlin, *Am. J. Physiol. Lung Cell Mol. Physiol.* (2001), 281:L58-L68).

Therefore, there is a need for new methods of increasing expression of Hsp70 in order to treat disorders responsive to Hsp70.

30 Extracellular Hsp70 and membrane bound Hsp70 have been shown to play key roles in activation of the innate immune system. Monocytes have been shown to secrete proinflammatory cytokines in response to soluble Hsp70 protein and membrane bound Hsp70 has been shown to provide a target structure for cytolytic attack by natural killer cell.

Natural killer (NK) cells, a type of white blood cell, are known to be an important component of the body's immune system. Because the defining function of NK cells is spontaneous cytotoxicity without prior immunization, NK cells can be the first line of defense in the immune system, and are believed to play a role in attacking cancer cells and infectious diseases. Many conditions, such as immunodeficiency diseases, aging, toxin exposure, endometriosis, and the like can leave subjects with lowered NK cell activity or dysfunctional NK cells.

For example, subjects can have decreased or deficient NK cell activity, in conditions such as chronic fatigue syndrome (chronic fatigue immune dysfunction syndrome) or Epstein-Barr virus, post viral fatigue syndrome, post-transplantation syndrome or host-graft disease, exposure to drugs such as anticancer agents or nitric oxide synthase inhibitors, natural aging, and various immunodeficiency conditions such as severe combined immunodeficiency, variable immunodeficiency syndrome, and the like. NK cells are known to have activity against a wide range of infectious pathogens such as bacteria, viruses, fungi, protozoan parasites, combined infections, e.g., combined

bacterial/viral infections, and the like. NK cells are believed to be particularly important in combating intracellular infections where the pathogens replicate in the subjects cells, e.g., a substantial fraction of viruses and many other pathogens that can form intracellular infections.

For example, a wide range of fungal infections are reported to be targeted by NK cells  
5 such as *Cryptococcus neoformans*, dermatophytes, e.g., *Trichophyton rubrum*, *Candida albicans*, *Coccidioides immitis*, *Paracoccidioides brasiliensis*, or the like (Hidore MR, Mislan TW, Murphy JW. Also targeted by NK cells are bacteria, especially intracellular bacteria, e.g., *Mycobacterium tuberculosis*, *Mycobacterium avium*, *Listeria monocytogenes*, many different viruses, such as human immunodeficiency virus, herpesviruses, hepatitis, and the like, and  
20 viral/bacterial co-infection (Esin S, Batoni G, Kallenius G, Gaines H, Campa M, Svenson SB, Andersson R, Wigzell H. In addition, NK cells combat protozoal infections including toxoplasmosis, trypanosomiasis, leishmaniasis and malaria, especially intracellular infections (Korbel DS, Finney OC, Riley EM. Natural killer cells and innate immunity to protozoan pathogens. *Int J Parasitol.* 2004 Dec;34(13-14):1517-28; Ahmed JS, Mehlhorn H. The role of cell-mediated immune responses in resistance to malaria, with special reference to oxidant stress. *Annu Rev Immunol.* 1983;1:361-92.)

NK cells have been shown to play a role in attacking cancer cells that present membrane bound Hsp70. It is believed that membrane bound Hsp70 binds to CD94 receptors on the surface of NK cells and cause them to produce and secrete high amounts of the enzyme, granzyme B which is thought to enter the tumor cell via interaction with membrane bound Hsp70 and induce apoptosis (see Radons and Multhoff, *Exerc. Immunol. Rev.* (2005), 11:17-33). Therefore, there is an urgent need for effective treatments for increasing NK cell activity for the treatment of cancer and other disorders that respond to NK induction.

As used herein, the term “bis(thio-hydrazide amide)” and references to the Structural Formulas of this invention also include pharmaceutically acceptable salts and solvates of these compounds and Structural Formulas. Examples of acceptable salts and solvates are described in US Publication No.: 20060135595 and US Patent Application Serial No.: 11/432,307 filed 11-May-2006, titled Synthesis Of Bis(Thio-Hydrazide Amide) Salts, the entire contents of each of which are incorporated herein by reference.

It is to be understood when one tautomeric form of a disclosed compound is depicted structurally, other tautomeric forms are also encompassed.

Certain compounds of the invention may be obtained as different stereoisomers (e.g., diastereomers and enantiomers). The invention includes all isomeric forms and racemic mixtures of the disclosed compounds and methods of treating a subject with both pure isomers and mixtures thereof, including racemic mixtures. Stereoisomers can be separated and isolated using any suitable method, such as chromatography.

An “alkyl group” is saturated straight or branched chain linear or cyclic hydrocarbon group. Typically, a straight chained or branched alkyl group has from 1 to about 20 carbon atoms, preferably from 1 to about 10, and a cyclic alkyl group has from 3 to about 10 carbon atoms, preferably from 3 to about 8. An alkyl group is preferably a straight chained or branched alkyl group, e.g, methyl, ethyl, *n*-propyl, *iso*-propyl, *n*-butyl, *sec*-butyl, *tert*-butyl, pentyl, hexyl, pentyl or octyl, or a cycloalkyl group with 3 to about 8 carbon atoms. A C1-C8 straight chained or branched alkyl group or a C3-C8 cyclic alkyl group is also referred to as a “lower alkyl” group. Suitable substituents for an alkyl group are those which do not substantially interfere with the anti-cancer activity of the disclosed compounds. Suitable substituents are as described below for aliphatic groups. Preferred substituents on alkyl groups include, -OH, -NH<sub>2</sub>, -NO<sub>2</sub>, -CN, -COOH, halogen, aryl, C1-C8 alkoxy, C1-C8 haloalkoxy and -CO(C1-C8 alkyl). More preferred substituents on alkyl groups include -OH,

halogen, phenyl, benzyl, pyridyl, and C1-C8 alkoxy. More preferred substituents on alkyl groups include -OH, halogen, and C1-C4 alkoxy.

A "straight chained hydrocarbyl group" is an alkylene group, i.e.,  $-(CH_2)_y-$ , with one or more (preferably one) internal methylene groups optionally replaced with a linkage group.  $y$  is a positive integer (e.g., between 1 and 10), preferably between 1 and 6 and more preferably 1 or 2. A "linkage group" refers to a functional group which replaces a methylene in a straight chained hydrocarbyl. Examples of suitable linkage groups include a ketone ( $-C(O)-$ ), alkene, alkyne, phenylene, ether ( $-O-$ ), thioether ( $-S-$ ), or amine ( $-N(R^a)-$ ), wherein  $R^a$  is defined below. A preferred linkage group is  $-C(R_5R_6)-$ , wherein  $R_5$  and  $R_6$  are defined above. Suitable substituents for an alkylene group and a hydrocarbyl group are those which do not substantially interfere with the anti-cancer activity of the disclosed compounds.  $R_5$  and  $R_6$  are preferred substituents for an alkylene or hydrocarbyl group represented by Y.

An aliphatic group is a straight chained, branched or cyclic non-aromatic hydrocarbon which is completely saturated or which contains one or more units of unsaturation. Typically, a straight chained or branched aliphatic group has from 1 to about 20 carbon atoms, preferably from 1 to about 10, and a cyclic aliphatic group has from 3 to about 10 carbon atoms, preferably from 3 to about 8. An aliphatic group is preferably a straight chained or branched alkyl group, e.g. methyl, ethyl, *n*-propyl, *iso*-propyl, *n*-butyl, *sec*-butyl, *tert*-butyl, pentyl, hexyl, pentyl or octyl, or a cycloalkyl group with 3 to about 8 carbon atoms. A C1-C8 straight chained or branched alkyl group or a C3-C8 cyclic alkyl group is also referred to as a "lower alkyl" group.

The term "aromatic group" may be used interchangeably with "aryl," "aryl ring," "aromatic ring," "aryl group" and "aromatic group." Aromatic groups include carbocyclic aromatic groups such as phenyl, naphthyl, and anthracyl, and heteroaryl groups such as imidazolyl, thienyl, furanyl, pyridyl, pyrimidy, pyranyl, pyrazolyl, pyrrolyl, pyrazinyl, thiazole, oxazolyl, and tetrazole. The term "heteroaryl group" may be used interchangeably with "heteroaryl," "heteroaryl ring," "heteroaromatic ring" and "heteroaromatic group." Heteroaryl groups are aromatic groups that comprise one or more heteroatom, such as sulfur, oxygen and nitrogen, in the ring structure. Preferably, heteroaryl groups comprise from one to four heteroatoms.

Aromatic groups also include fused polycyclic aromatic ring systems in which a carbocyclic aromatic ring or heteroaryl ring is fused to one or more other heteroaryl rings. Examples include benzothienyl, benzofuranyl, indolyl, quinolinyl, benzothiazole, benzooxazole, benzimidazole, quinolinyl, isoquinolinyl and isoindolyl.

Non-aromatic heterocyclic rings are non-aromatic rings which include one or more heteroatoms such as nitrogen, oxygen or sulfur in the ring. The ring can be five, six, seven or eight-membered. Preferably, heterocyclic groups comprise from one to about four heteroatoms. Examples include tetrahydrofuranyl, tetrahydrothiophenyl, morpholino, thiomorpholino, pyrrolidinyl, piperazinyl, piperidinyl, and thiazolidinyl.

Suitable substituents on an aliphatic group (including an alkylene group), non-aromatic heterocyclic group, benzylic or aryl group (carbocyclic and heteroaryl) are those which do not substantially interfere with the anti-cancer activity of the disclosed compounds. A substituent substantially interferes with anti-cancer activity when the anti-cancer activity is reduced by more than about 50% in a compound with the substituent compared with a compound without the substituent. Examples of suitable substituents include -R<sup>a</sup>, -OH, -Br, -Cl, -I, -F, -OR<sup>a</sup>, -O-COR<sup>a</sup>, -COR<sup>a</sup>, -CN, -NO<sub>2</sub>, -COOH, -SO<sub>3</sub>H, -NH<sub>2</sub>, -NHR<sup>a</sup>, -N(R<sup>a</sup>R<sup>b</sup>), -COOR<sup>a</sup>, -CHO, -CONH<sub>2</sub>, -CONHR<sup>a</sup>, -CON(R<sup>a</sup>R<sup>b</sup>), -NHCOR<sup>a</sup>, -NR<sup>c</sup>COR<sup>a</sup>, -NHCONH<sub>2</sub>, -NHCONR<sup>a</sup>H, -NHCON(R<sup>a</sup>R<sup>b</sup>), -NR<sup>c</sup>CONH<sub>2</sub>, -NR<sup>c</sup>CONR<sup>a</sup>H, -NR<sup>c</sup>CON(R<sup>a</sup>R<sup>b</sup>), -C(=NH)-NH<sub>2</sub>, -C(=NH)-NHR<sup>a</sup>, -C(=NH)-N(R<sup>a</sup>R<sup>b</sup>), -C(=NR<sup>c</sup>)-NH<sub>2</sub>, -C(=NR<sup>c</sup>)-NHR<sup>a</sup>, -C(=NR<sup>c</sup>)-N(R<sup>a</sup>R<sup>b</sup>), -NH-C(=NH)-NH<sub>2</sub>, -NH-C(=NH)-NHR<sup>a</sup>, -NH-C(=NH)-N(R<sup>a</sup>R<sup>b</sup>), -NH-C(=NR<sup>c</sup>)-NH<sub>2</sub>, -NH-C(=NR<sup>c</sup>)-NHR<sup>a</sup>, -NH-C(=NR<sup>c</sup>)-N(R<sup>a</sup>R<sup>b</sup>), -NR<sup>d</sup>H-C(=NH)-NH<sub>2</sub>, -NR<sup>d</sup>-C(=NH)-NHR<sup>a</sup>, -NR<sup>d</sup>-C(=NH)-N(R<sup>a</sup>R<sup>b</sup>), -NR<sup>d</sup>-C(=NR<sup>c</sup>)-NH<sub>2</sub>, -NR<sup>d</sup>-C(=NR<sup>c</sup>)-NHR<sup>a</sup>, -NR<sup>d</sup>-C(=NR<sup>c</sup>)-N(R<sup>a</sup>R<sup>b</sup>), -NHNH<sub>2</sub>, -NHNHR<sup>a</sup>, -NHR<sup>a</sup>R<sup>b</sup>, -SO<sub>2</sub>NH<sub>2</sub>, -SO<sub>2</sub>NHR<sup>a</sup>, -SO<sub>2</sub>NR<sup>a</sup>R<sup>b</sup>, -CH=CHR<sup>a</sup>, -CH=CR<sup>a</sup>R<sup>b</sup>, -CR<sup>c</sup>=CR<sup>a</sup>R<sup>b</sup>, -CR<sup>c</sup>=CHR<sup>a</sup>, -CR<sup>c</sup>=CR<sup>a</sup>R<sup>b</sup>, -CCR<sup>a</sup>, -SH, -SR<sup>a</sup>, -S(O)R<sup>a</sup>, -S(O)<sub>2</sub>R<sup>a</sup>.

The entire teachings of these applications are incorporated herein by reference.

The present invention is illustrated by the following examples, which are not intended to be limiting in any way.

#### EXAMPLE 1: Purification of Compound 1

Compound 1 used in the following purification procedures was prepared by the following procedure. 274.3 kg of RO/DI water was added to a reactor (10 °C). 5.475 g of NaOH pellets were added until a clear solution was obtained. 28.35 kg of S-(thiobenzoyl)thioglycolic acid was added to the reactor (0-5 °C). 7.965 kg of methylhydrazine was added to the reactor while stirring (0-10 °C). The reactor temperature was increased to 20.0 °C over 150 minutes. The precipitate of thiobenzoyl-N<sup>1</sup>-methylhydrazide (19.05 kg) was collected.

18.95 kg of thiobenzoyl-N<sup>1</sup>-methylhydrazide was added to a reactor and 221.6 kg of anhydrous ethyl acetate was added with stirring. After the material was dissolved, the reactor was cooled to 4.0 °C. 12.13 kg of TEA was added to the reactor, followed by a solution of malonyl chloride (9.30 kg) in anhydrous ethyl acetate (34.0kg) (-5 to 10 °C). The reactor temperature was increased to 11.4 °C over 95 min. 96.15 kg of RO/DI water was added (2.5 °C +/- 2.5 °C) and stirred for 20 min. NaCl solution (11.430 kg in 19.07 kg RO/DI water) was added in two portions (draining aqueous layer after each addition) and stirred (27 min, 19

min). The organic layer was washed with ACS ethyl acetate. Ethyl acetate was removed by distillation at 100 +/- 50 mm Hg (23-28 °C). The cake was washed with ethyl acetate. The product was dried under vacuum and N-malonyl-bis(N'-methyl-N'-thiobenzoylhydrazide) (15.233 kg) was collected.

5        *Purification procedure (THF-CH<sub>3</sub>CN-H<sub>2</sub>O):* To a solution of Compound 1 (2g, 95%) in THF (20ml) was added CH<sub>3</sub>CN (6ml), cooled to 0-4 °C. To the mixture was added cold water (0-4 °C, 60ml) with stirring. The whole solution was stirred for 3 h followed by filtration. The precipitate was washed with cold THF-H<sub>2</sub>O (1:3, v/v), and dried to give Compound 1 (1.8 g, 98%).

10       *Purification procedure (THF-Acetone-H<sub>2</sub>O):* To a solution of Compound 1 (2g, 95%) in THF (20ml) was added acetone (6ml), cooled to 0-4 °C. To the mixture was added cold water (0-4 °C, 60ml) with stirring. The whole solution was stirred for 3 hr, and filtered. The precipitate was washed with cold THF-H<sub>2</sub>O (1:3), and dried to give Compound 1 in a yield and purity similar to the method described above.

15       99+% pure Compound 1 was obtained by combination of the above two procedures sequentially.

The data from purification procedures with Compound 1 is provided in Tables 1 and 2.
